

Heritage Treasures An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

1.2 – Purpose of the Project

The main goal of "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau" is to look at UNESCO World Heritage Sites in a lot of detail. We want to understand where these sites are, what makes them special and what kinds of things we can learn from them. UNESCO World Heritage Sites are really important because they are some of the valuable cultural, natural and mixed heritage locations in the world. These sites are recognized for being very special and important to everyone, not the countries where they are located.

One of the things we want to do with this project is to give people a complete overview of UNESCO World Heritage Sites all around the world. We are looking at things like where the sites are, what kinds of sites they are when they were added to the list and where they are located on a map. By looking at all this information, we can see patterns and trends that might not be easy to see by looking at the numbers. The maps we make help answer important questions like which countries have the most heritage sites, how the sites are spread out across the world and what kinds of heritage sites are most common.

Natural heritage sites include things like forests, mountains and wildlife habitats that're very important for the environment. Mixed heritage sites are a combination of natural significance. By looking at these types of sites we can learn about how different countries are working to protect their cultural and natural heritage.

We also want to see how the recognition of UNESCO World Heritage Sites has changed over time. By looking at when sites were added to the list we can see how the way we think about preserving heritage has changed. This helps us understand how the program has grown, when there were times when a lot of sites were added and how people's awareness of environmental conservation has changed. Looking at these trends gives us insights into how people's priorities for protecting heritage have changed.

The project is also meant to educate people about the importance of preserving natural heritage. Many heritage sites are in danger because of things like cities growing, the environment being hurt, climate change, natural disasters and human conflict. By showing people how important these sites are and where they are we hope to make people appreciate the heritage of the world and want to help protect it. We want people to

understand why it is so important to protect monuments, cultural traditions, natural landscapes and biodiversity for the people who come after us.

This project also shows how data analytics and business intelligence tools can be used to solve real-world problems. It shows how Tableau can be used to collect organize, analyze and present data in a way that makes sense. By making pictures and stories the project helps people think more critically understand data better and tell stories with the data. It gives people experience with getting data ready designing pictures and finding insights which're all important skills for people who work with data.

the project also wants to help researchers, students, teachers, policymakers and people who love heritage by giving them a place to look at UNESCO World Heritage data. The pictures and maps make the information more accessible and easier to understand so people do not need to be experts to learn about global heritage sites. This makes it easier for people to get involved and have informed discussions about conservation and cultural preservation.

Ultimately the goal of "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau" is to connect the data to what it means. By combining analysis, with interactive storytelling the project turns raw information into insights that educate, inform and inspire people. It shows us how rich and diverse the natural heritage of the world is and how important it is to preserve these treasures for the people who come after us. It also shows us the power of data visualization tools to help us understand the world better.
