

# Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

## CHAPTER – II

### IDEATION PHASE

#### 1.2 – Problem Statement:

UNESCO World Heritage Sites are some of the important cultural, natural and mixed heritage places in the world. These sites have historical, cultural and environmental value. Information about them is often hard to find and understand because it is spread across many reports and datasets. This makes it tough to see patterns and learn things. Understanding where heritage sites are what they are classified as and how they have changed over time is crucial for researchers, students, policymakers and organizations that protect heritage sites.

UNESCO World Heritage data is available. It is not easy to explore and understand. Reports and tables do not show patterns of heritage sites around the world or how countries compare. As a result, important insights that could help people learn about and protect heritage sites are hidden in data. This project solves the problem by using Tableau to turn UNESCO World Heritage Site data into dashboards, maps and stories. The project provides an analysis of heritage sites worldwide. Users can explore where sites are comparing countries and regions and analyze natural and mixed heritage categories. The project helps people understand heritage better and see why preserving these sites is important, for the future. By presenting data in an easy-to-understand way the project aims to raise awareness and support conservation efforts. UNESCO World Heritage Sites are valuable. Need to be protected.

This project helps make that happen.
