3.3 – Data Flow Diagram: The Data Flow Diagram shows how information is gathered, handled and turned into pictures for the "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau" project. The process starts with gathering information from places like the UNESCO World Heritage Centre, UNESCO WHC datasets, Kaggle datasets and other sources that have details about countries, areas and heritage sites.

The gathered information is then taken to the Data Ingestion stage, where it is put into Tableau. In this stage the information is checked, connected and confirmed to make sure it is correct and in the format. This helps keep the information consistent and ready for analysis.

In the Data Transformation stage, the information is cleaned up. Unwanted information is. Duplicate records are taken out. Missing values are. Information formats like country names, areas, categories and years are made the same. More checks and additions are done to make the information better and more accurate.

After transformation the cleaned information is stored in a format called Tableau Data Extract (.hyper) along with details about the information and a list of what the information means. This storage stage helps manage the information and makes it work faster when making pictures and analysing.

The handled information is then used in Tableau to make maps, charts, graphs and interactive pages. These pictures help users look at UNESCO World Heritage Sites, compare countries and areas find trends and get insights from the information. The

Heritage Treasures An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

information is given to people who use it like researchers, students, teachers, people who love heritage policymakers and the general public. Users can look at the pages analyse information share what they find and make decisions. A feedback loop is part of the process allowing users to give feedback to make the information, pictures and overall experience better. The Data Flow Diagram helps to understand how information is handled and turned into pictures for the "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites, in Tableau" project and its users.
