PROJECT DESIGN

4.1 – Problem Solution Fit: For the "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau" project the problem found was that information about UNESCO World Heritage Sites is usually over the place and in big datasets that are hard for people to make sense of.

Students and researchers and tourists and people who love things may have a tough time looking at global heritage data, comparing countries and finding trends that matter when they only have raw data to look at.

The idea was to make a platform using Tableau that takes complicated UNESCO heritage data and turns it into simple dashboards and maps and charts and stories.

When people use Tableau to visualize the data, they can quickly look at heritage sites compare areas and analyze the types of sites and they can get a lot of useful information from the interactive parts.

This solution really works because it makes heritage data easier to get to and it organizes the data in a way that's nice to look at.

It helps people understand what is going on with heritage around the world. It is good, for people who are learning and doing research and it reminds people why UNESCO World Heritage Sites are so important.

So the project does a job of solving the problem by giving people a simple and informative way to look at and analyze heritage data.

The "Heritage Treasures" project and UNESCO World Heritage Sites are a team and the project really helps people understand UNESCO World Heritage Sites.
