

Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau

TEAM ID	SWTID-2026-2399
PROJECT TITLE	Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau"
MAX MARKS	5 MARKS

4.3 – Solution Architecture: The Solution Architecture of "Heritage Treasures: An In-Depth Analysis of UNESCO World Heritage Sites in Tableau" is about getting UNESCO World Heritage data making it look nice and easy to understand and showing it on a website that people can use.

It starts with getting the UNESCO World Heritage data from sources. This data is then connected to Tableau Desktop, where it is made clean and organized and then analyzed. Lots of worksheets are made to show parts of the data. These worksheets are then put together to make dashboards and stories that give people a complete view of UNESCO World Heritage Sites.

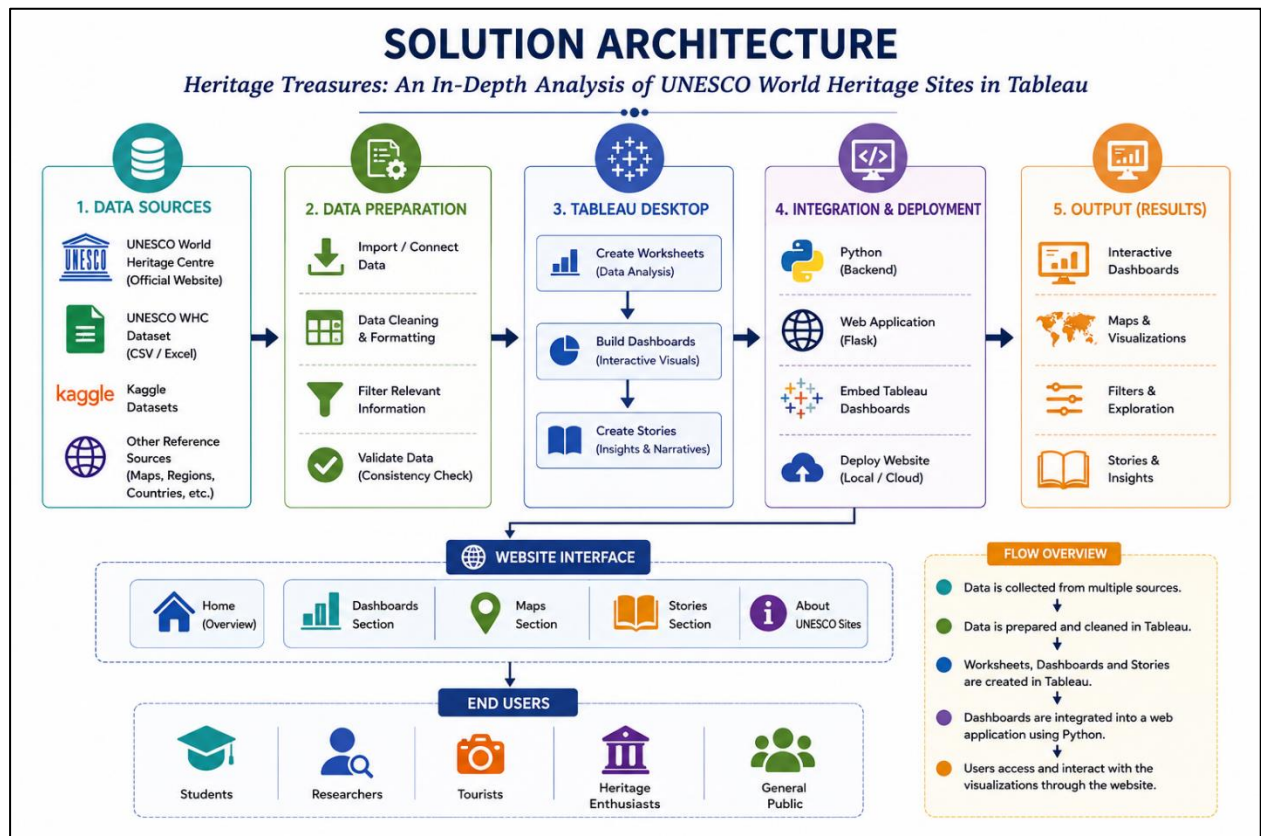

When the Tableau visualizations are done they are put into a website made with Python. This website is like a place where people can go to use the dashboards. People can look at maps, charts and stories to see where UNESCO World Heritage Sites are and why they are important, around the world.
